# CM 3.3: Continuous Random Variables

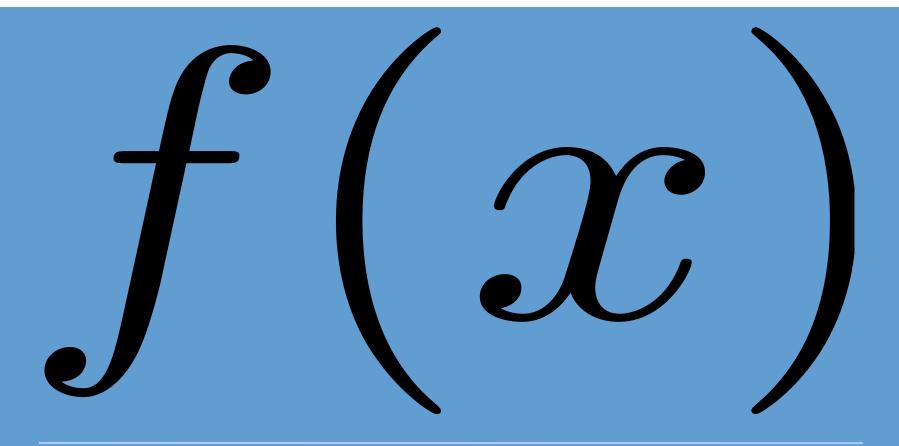

# Past: discrete rvs Present: continuous rvs

• for discrete rvs, P(X = x) is technically called the probability mass function

for continuous rvs, the analogous concept is the density

# Density

- The density of *X* can be seen as a value proportional to the chance of drawing from the population a number that is lying in the close proximity of *X*.
- Sadly, density does not give you probabilities directly
- Probabilities can only be obtained from densities by taking an integral
- Integrals are simply continuous sums

For continuous X, f(x) is a Probability Density Function\*

# Continuous rv pdf

$$1. \int_{-\infty}^{\infty} f(x) dx = 1$$

$$2.f(x) \ge 0$$
 always

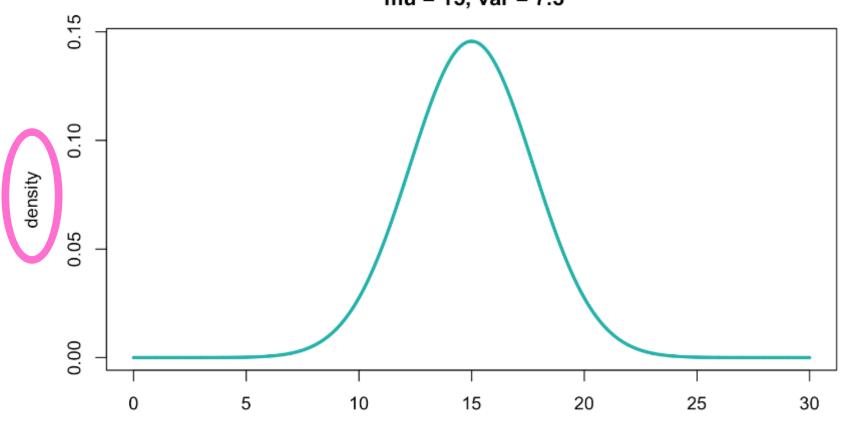

## What does P(X = a) = ?

$$P(a < X < b) = \int_{a}^{b} f(x)dx$$
$$P(a \le X \le b) = \int_{a}^{b} f(x)dx$$

# One continuous distribution: Gaussian/normal

- Let's use the mean and sd from the coin flip example:
  - mean = 15
  - sd = 2.74

#### normal distribution pdf mu = 15, var = 7.5

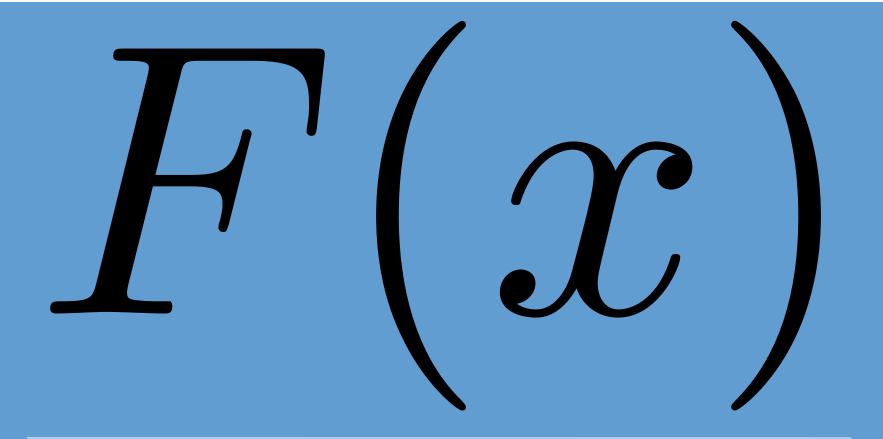

Х

## Questions we can ask the pdf

• "What is the height of the density curve at x = 10?" 0.028

```
dnorm(10, 15, sqrt(7.5))
```

For all X, F(x) is a cumulative distribution function

## Cumulative distribution function

$$1. F(x) \rightarrow 1 \ as \ x \rightarrow \infty$$

$$2. F(x) \rightarrow 0 \ as \ x \rightarrow -\infty$$

- 3. F(x) is monotonic; never decreasing
- 4. F(x) does not need to be smooth but is continuous

$$F(x) = P(X \le x)$$

Discrete

Continuous

$$F(x) = \sum_{t \le x} f(t) \left| F(x) = \int_{-\infty}^{x} f(t) dt \right|$$

$$F(x) = \int_{-\infty}^{\infty} f(t)dt$$

(since x is used as a variable in the upper limit of integration, we use some other variable, say "t", in the

# cdf in practice

- F(x) is the probability of values less than x
- Thus, F(x) is the probability of an interval
- If F(x) is the cdf for the age in months of fish in a lake, then F(10) is the probability a random fish is 10 months or younger.
- Can F(10) be less than F(9)?

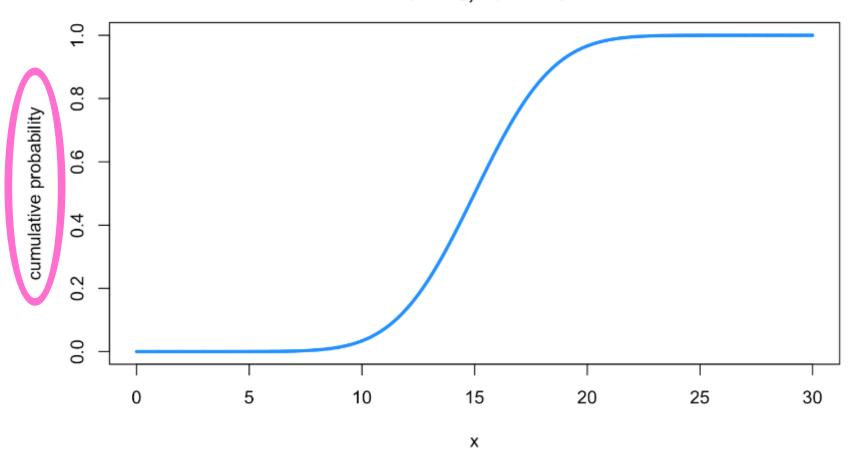

### cdf for continuous rvs

By the Fundamental Theorem of Calculus:

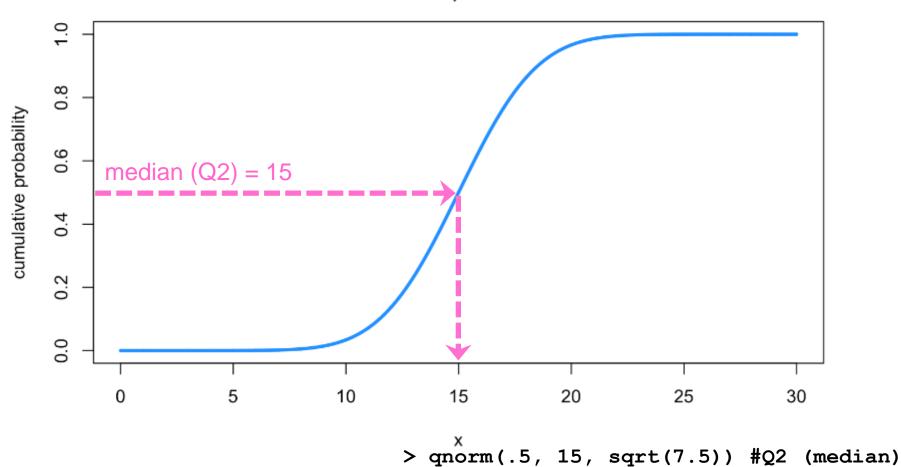

$$F(b) - F(a) = \int_{a}^{b} f(x)dx$$

The area under the curve from a to b of a function f is just the difference between the values of that function's antiderivative, F, at b and a.

#### normal distribution cdf mu = 15, var = 7.5

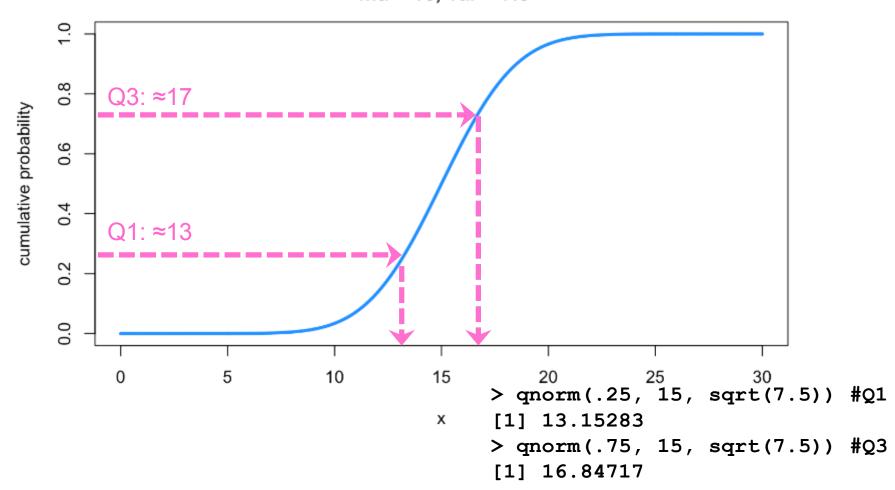

#### normal distribution cdf mu = 15, var = 7.5

[1]

15

#### normal distribution cdf mu = 15, var = 7.5

## Questions we can ask the cdf in R

- "What is the probability that x is exactly 7?" 0
- "What is the probability that x is between 18 to 24?" 0.136
- "What is the probability that x ends in 7?"
- "What is the probability that x is greater than 24?" 0.0005

## Questions we can ask the cdf in R

- "What is the probability that x is exactly 7?"
- "What is the probability that x is between 18 to 24?" 0.136

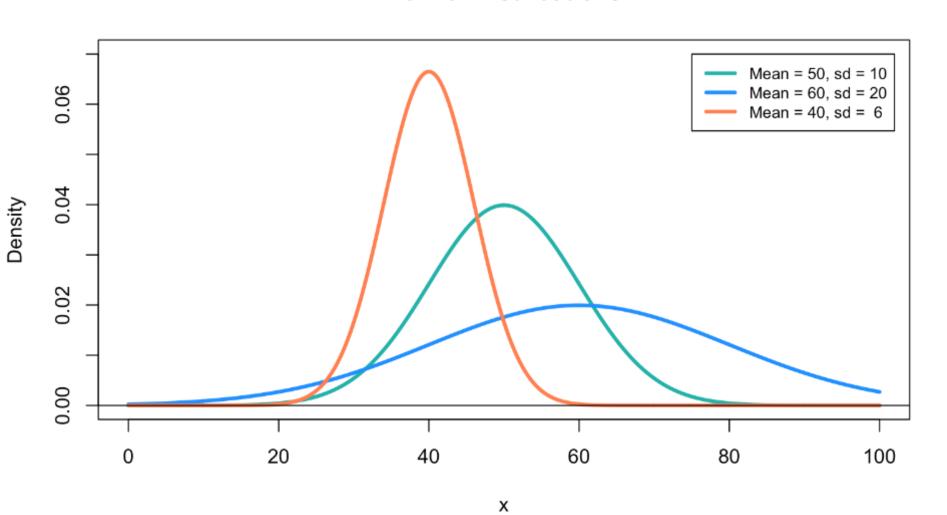

```
pnorm(24, 15, sqrt(7.5)) - pnorm(18, 15, sqrt(7.5))
```

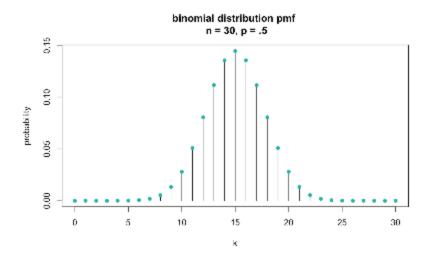

- "What is the probability that x ends in 7?" 0
- "What is the probability that x is greater than 24?" 0.0005

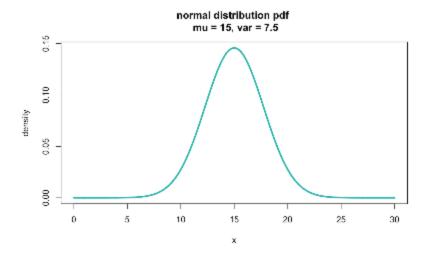

```
pnorm(24, 15, sqrt(7.5), lower.tail = FALSE)
```

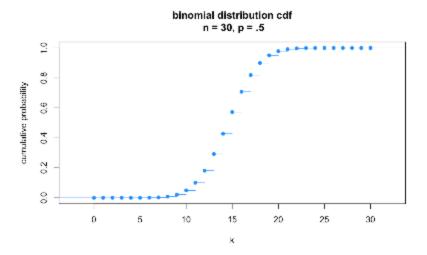

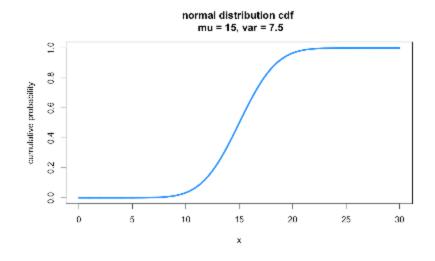

#### **Normal Distributions**

## **Transformations**

- If  $X \sim N(\mu, \sigma^2)$  and Y = X + b
  - Then  $Y \sim N(\mu + b, \sigma^2)$
- If  $X \sim N(\mu, \sigma^2)$  and Y = aX
  - Then  $Y \sim N(a\mu, a^2\sigma^2)$
- If  $X \sim N(\mu, \sigma^2)$  and Y = aX + b
  - Then  $Y \sim N(a\mu + b, a^2\sigma^2)$

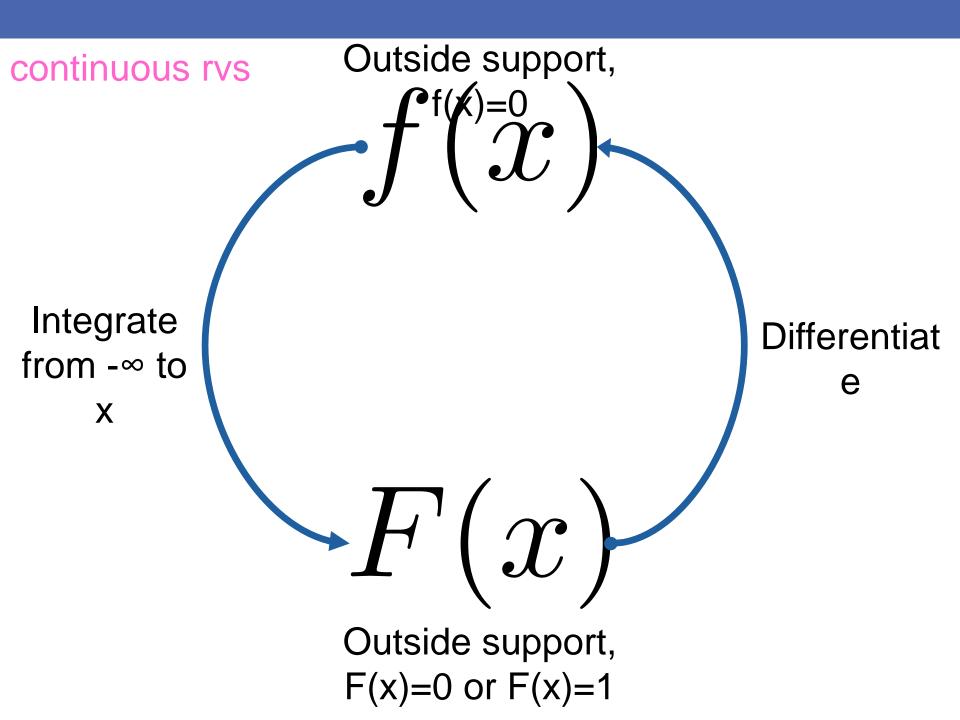

### Random variables

#### Discrete

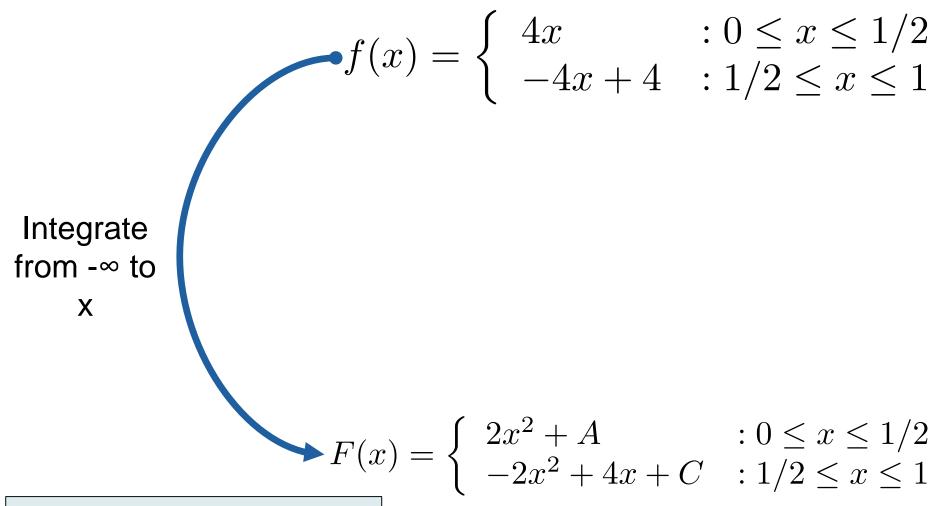

- Finite or countably infinite sample space.
- Subset of integers.
- Use sums.
- Has pmf.

#### Continuous

- Uncountably infinite sample space.
- Subset of the real number line.
- Use integrals.
- Has pdf.

### X is a continuous rv

#### Wolfram Alpha:

integrate  $4x = 2x^2 + constant$ integrate  $-4x + 4 = -2x^2 + 4x +$ 

## How to solve for A and C

$$F(x) = \begin{cases} 2x^2 + A & : 0 \le x \le 1/2 \\ -2x^2 + 4x + C & : 1/2 \le x \le 1 \end{cases}$$

Where A and C are constants of integration. Now we use the properties of F(x) to solve for those constants.

### Specifically:

- 1. We know:  $F(x_{min}) = 0$ ; so F(0) = 0
- 2. We also know:  $F(x_{max}) = 1$ ; so F(1) = 1

## Solve for A first

$$F(x) = \begin{cases} 2x^2 + A & : 0 \le x \le 1/2 \\ -2x^2 + 4x + C & : 1/2 \le x \le 1 \end{cases}$$

$$F(x=0) = 0 = 2(0^2) + A$$
, so  $A = 0$ 

## Solve for C next

$$F(x) = \begin{cases} 2x^2 + A & : 0 \le x \le 1/2 \\ -2x^2 + 4x + C & : 1/2 \le x \le 1 \end{cases}$$

$$F(x = 1) = 1 = -2(1^2) + (4 \times 1) + C$$
, so  $C = -1$ 

# Plug in: A = 0; C = -1

$$F(x) = \begin{cases} 2x^2 + A & : 0 \le x \le 1/2 \\ -2x^2 + 4x + C & : 1/2 \le x \le 1 \end{cases}$$

$$F(x) = \begin{cases} 2x^2 & : 0 \le x \le 1/2 \\ -2x^2 + 4x - 1 & : 1/2 \le x \le 1 \end{cases}$$

# Alternative way to solve for C

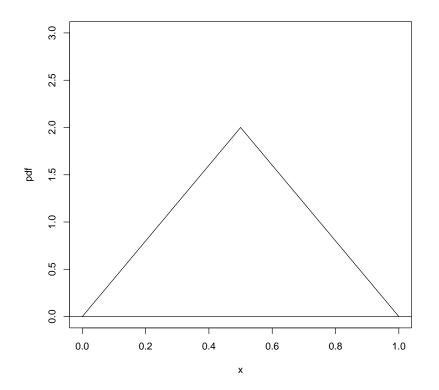

• F(x) must be continuous, meaning that the graph of F(x) must touch when x = 1/2 (the two pieces of the piecewise graph must touch). So, to solve for C, we set x = 1/2 for each equation, plug in A = 0, and make them equal each other.

$$F(.5) = 2(.5^2) = -2(.5^2) + 4(.5) + C$$

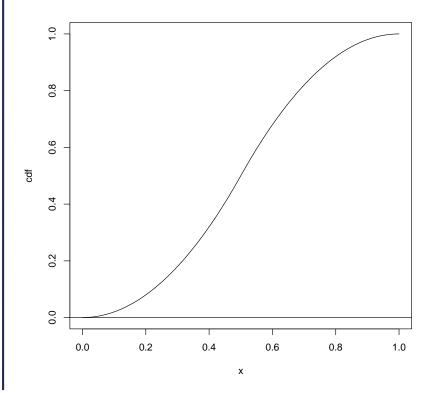

$$F(.5) = .5 = 1.5 + C$$

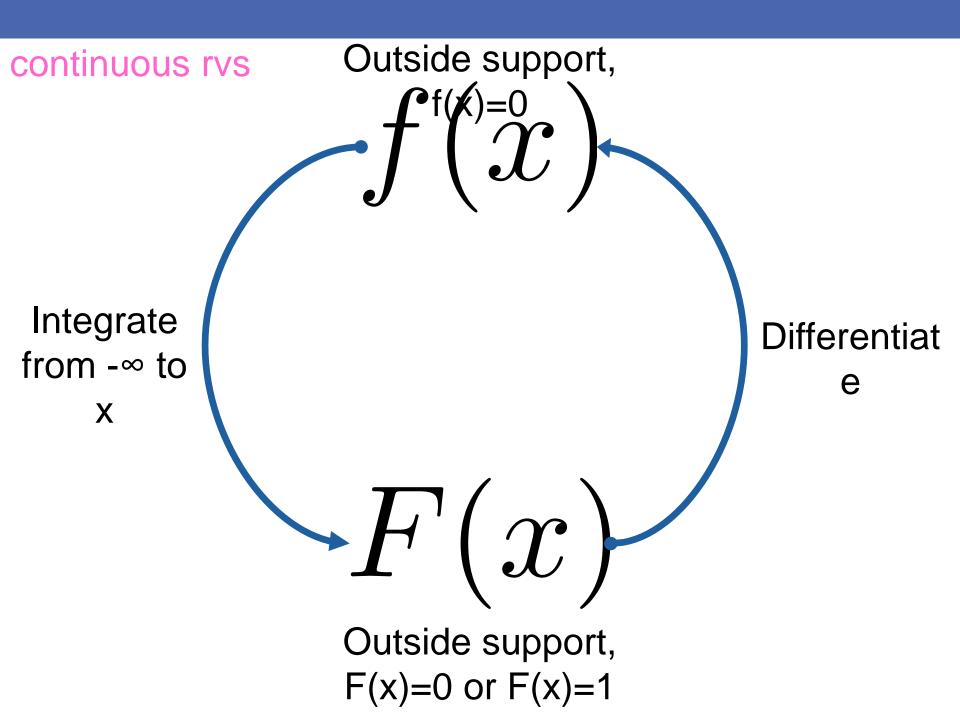

$$C = .5 - 1.5 = -1$$

$$f(x) = \begin{cases} 4x & : 0 \le x \le 1/2 \\ -4x + 4 & : 1/2 \le x \le 1 \end{cases}$$

$$F(x) = \begin{cases} 2x^2 & : 0 \le x \le 1/2 \\ -2x^2 + 4x - 1 & : 1/2 \le x \le 1 \end{cases}$$

### X is a continuous rv

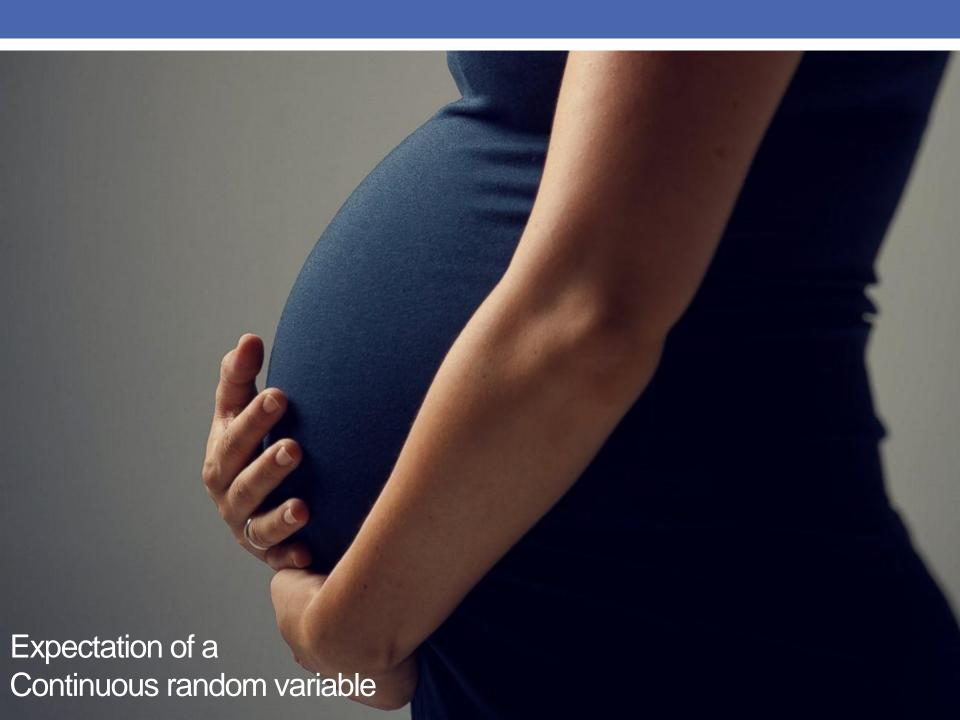

$$f_X(x) = \begin{cases} 1/2 & -1 \le x < 1, \\ 0 & \text{otherwise} \end{cases}$$

Differentiat e

$$F_X(x) = \begin{cases} 0 & x < -1, \\ (x+1)/2 & -1 \le x < 1, \\ 1 & x \ge 1. \end{cases}$$

Wolfram Alpha:

differentiate 0 = 0differentiate  $(x+1)/2 = \frac{1}{2}$ differentiate 1 = 0

$$E[X] = \int_{-\infty}^{\infty} x f(x) dx$$

$$Var(X) = \int_{-\infty}^{\infty} (x = E(X))^2 f(x) dx$$

# Population median from pdf

- Halfway point: half the population has a lower value, and half has a higher value
- If f(x) is a pdf, then the median of the distribution is the point M such that:

$$\int_{-\infty}^{M} f(x)dx = 0.5$$

# Example: ladybug median life span

Suppose a ladybug's life span (in months) has a pdf:

$$f(x) = \begin{cases} \frac{1}{72}x, & 0 \le x \le 12\\ 0, & \text{otherwise} \end{cases}$$

What is the median life span for the ladybug population?

# Example: ladybug median life span

$$\frac{1}{2} = \int_0^M \frac{1}{72} x dx = \frac{1}{144} x^2 \Big|_0^M = \frac{1}{144} M^2$$

$$\frac{1}{2} = \frac{1}{144}M^{2}$$

$$72 = M^{2}$$

$$M = \sqrt{72} = 8.49$$

# Aside: wolfram alpha

#### Wolfram Alpha Step-by-step Solution

integrate xdx from 0 to m

Definite integral:

$$\int_0^m x \, dx = \frac{m^2}{2}$$

Compute the definite integral:

$$\int_{0}^{m} x \, dx$$

Apply the fundamental theorem of calculus.

The antiderivative of x is  $\frac{x^2}{2}$ :

$$=\frac{x^2}{2} \Big|_{0}^{m}$$

$$f(8.49) = \int_0^{8.49} \frac{1}{72} x dx = 0.5$$

If we had the cdf, we could check this result:

$$F(M) = F(8.49) = 0.5$$

How do we get there from the pdf? Integrate!

I know what you are thinking- I do so wish we could do more integration!

$$f(x) = \begin{cases} \frac{1}{72}x, & 0 \le x \le 12\\ 0, & \text{otherwise} \end{cases}$$

$$F(x) = \begin{cases} \frac{1}{144}x^2 + \text{constant}, & 0 \le x \le 12\\ 0, & \text{otherwise} \end{cases}$$

$$F(x) = \begin{cases} \frac{1}{144}x^2 + \text{constant}, & 0 \le x \le 12\\ 0, & \text{otherwise} \end{cases}$$

constant = 0 (do this one on your own) ---

$$F(x) = \begin{cases} \frac{1}{144}x^2, & 0 \le x \le 12\\ 0, & \text{otherwise} \end{cases}$$

> (1/144) \* (8.49^2) [1] 0.5005563

$$F(M) = F(8.49) = 0.5$$

# Using the cdf

- Now we can answer so many more questions without having to integrate each time...
- Q1? 6
- Q3? 10.4
- IQR? 4.4

# Example: ladybug mean life span

Suppose a ladybug's life span has a pdf:

$$f(x) = \begin{cases} \frac{1}{72}x, & 0 \le x \le 12\\ 0, & \text{otherwise} \end{cases}$$

What is the mean life span for the ladybug population?

$$\int_{-\infty}^{+\infty} x f(x) dx$$

## Example: ladybug mean life span

$$\int_{-\infty}^{+\infty} x f(x) dx = \int_{0}^{12} x (\frac{1}{72}x) dx$$

$$= \int_0^{12} \frac{1}{72} x^2 dx$$

$$= \frac{1}{216}x^3|_0^{12} = 8$$

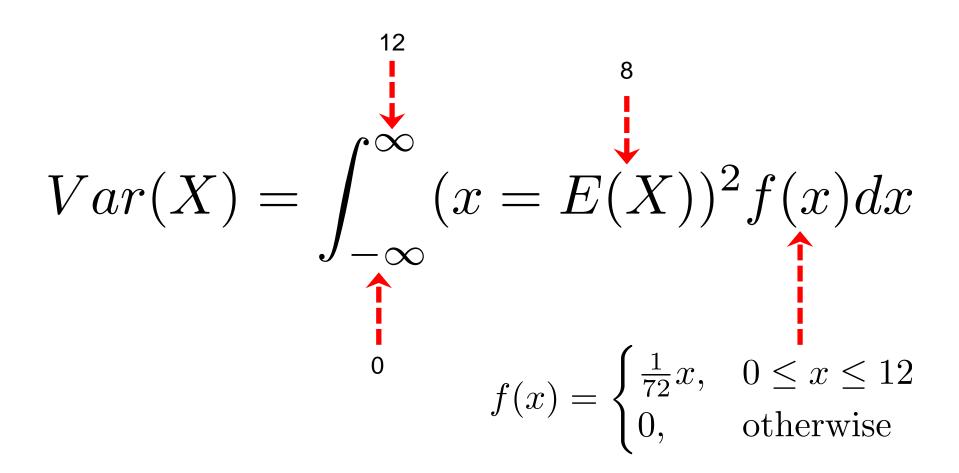

# Example: ladybug life spans

- What is the median life span? 8.49 months
- What is the mean life span? 8 months
- The mean is < median, so more than 50% of ladybugs live longer than 8 months
- What is the variance of ladybug life spar

I'll leave this for you to

# Variance of ladybug life spans

## Mini-review: probability functions

Discrete rvs: probability mass function (pmf)

- f(x) is defined by the distribution!
- Famous ones:
  - Bernoulli
  - Binomial
  - Negative binomial
  - Geometric
  - Hypogeometric
  - Poisson

Continuous rvs: probability density function (pdf)

- *f*(*x*) is defined by the distribution!
- Famous ones:
  - Normal/Gaussian
  - Chi-squared
  - F
  - Student's t
  - Gamma
  - Beta

#### Mini-review: conditions for probability functions

Probability	Discrete rv: f(x) is a pmf if	Continuous rv: $f(x)$ is a pdf if
$P(A) \ge 0$ for all $A \in \Omega$	$f(x) > 0$ for all $x \in \Omega$	` ´
$P(\Omega) = 1$	$\sum_{x_i \in \Omega} f(x_i) = 1$	$\int_{\mathbb{R}} f(x) = 1$

#### Mini-review: cumulative density functions

Discrete rvs

Continuous rvs

$$F(x) = \sum_{t \le x} f(t) \Big|_{F(x)} = \int_{-\infty}^{x} f(t) dt$$

$$F(x) = \int_{-\infty}^{x} f(t)dt$$

where *f*(*t*) is just the pmf/pdf

## Mini-review: Expectation of an rv

Discrete rvs

Continuous rvs

$$E(X) = \sum_{\text{all } x} x f(x) \bigg|_{E(X)} = \int_{-\infty}^{\infty} x f(x) dx$$

$$E(X) = \int_{-\infty}^{\infty} x f(x) dx$$

#### Mini-review: Variance of an rv

Discrete rvs

Continuous rvs

$$Var(X) = \sum_{\text{all } x} (x - \mu_X)^2 f(x) \quad Var(X) = \int_{-\infty}^{\infty} (x - \mu_X)^2 f(x) dx$$

$$Var(X) = \int_{-\infty}^{\infty} (x - \mu_X)^2 f(x) dx$$

# What you need to know about distributions

- That lots of distributions exist (not just the normal!), and what types of rvs can typically be represented by them
- What the pmf/pdf represents in terms of probability
- What the cdf represents in terms of probability
- How to calculate the expectation value and variance of the distribution, given the pmf/pdf
- How to determine the pdf from the cdf for any function
  - Requires differentiation
- How to determine the cdf from the pdf for any function
  - Requires integration
